# Memory Management

## 0. Laboratory performing script

To perform all researches I wrote a bash script called *mm\_lab.sh*. There are three options to execute that script:

1. With 'setup' parameter – this call results that the script will setup and compile simulator environment.
2. With 'run' parameter – this call results that the script will run a simulator with a configuration files (*memory.conf*, *commands*).
3. With 'clean' parameter – this call results that the script will remove all the obtained results and MOSS Simulator environment.

Link: <https://github.com/wiktorlazarski/Operating-Systems/tree/master/4.memory%20management>

## 1. Mapping virtual to physical pages

First we need to map any 8 pages of physical memory to the first 8 pages of virtual pages. To do this I wrote a *memory.conf* file in the following way.

```
./memory.conf
memset 0 7 0 0 0 0
memset 1 6 0 0 0 0
memset 2 5 0 0 0 0
memset 3 4 0 0 0 0
memset 4 3 0 0 0 0
memset 5 2 0 0 0 0
memset 6 1 0 0 0 0
memset 7 0 0 0 0 0

enable_logging true

log_file ../../tracefile

pagesize 16384

addressradix 10

numpages 64
```

# Memory Management

Below the description of each *memory.conf* file can be found in a table below.

| Keyword               | Description   |
|-----------------------|---|
| <i>memset</i>         | <i>memset</i> is a keyword that performs mapping between virtual page and physical page. Following digits represent as follow:<br>virt page # physical page # R (read from) M (modified) inMemTime (ns) |
| <i>enable_logging</i> | <i>enable_logging</i> 'true' or 'false'<br>When true specify a <i>log_file</i> or leave blank for stdout  |
| <i>log_file</i>       | <i>log_file</i> <FILENAME><br>Where <FILENAME> is the name of the file you want output to be print to.  |
| <i>pagesize</i>       | page size, defaults to $2^{14}$ and cannot be greater than $2^{26}$<br><i>pagesize</i> <single page size (base 10)> or <'power' num (base 2)>   |
| <i>addressradix</i>   | <i>addressradix</i> sets the radix in which numerical values are displayed 2 is the default value<br><i>addressradix</i> <radix>  |
| <i>numpages</i>       | <i>numpages</i> sets the number of pages (physical and virtual) 64 is the default value <i>numpages</i> must be at least 2 and no more than 64<br><i>numpages</i> <num>                                 |

To fulfil the first part of laboratory task, 'map any 8 physical pages to first 8 virtual pages', *memset* keyword was used. This mapping process is highlighted above, by a red square shown in a table which presents *memory.conf* file. In this step I decided to map virtual pages to physical pages as follow:

| Virtual Page | Physical Page |
|--------------|---------------|
| 0            | 7             |
| 1            | 6             |
| 2            | 5             |
| 3            | 4             |
| 4            | 3             |
| 5            | 2             |
| 6            | 1             |
| 7            | 0             |

## 2. Reading every virtual page

Then we need to specify the steps that the simulator will be performing. For this we will write a separate file called *commands*. In this file, according to the laboratory task, I need to specify read operation from every 64 virtual pages specified in my simulator (by keyword *numpages* in *memory.conf* file).

To ensure that every address in every virtual page will be read we need to do some math. In *memory.conf* file, we specified that every virtual page will consists of 16384 addresses via keyword *pagesize*. Therefore, to ensure that address from every virtual page will be read we need to write READ command in *commands* file that will read every address that is multiplication of 16384. We can pick any but I have decided to read every first address of every  $i^{th}$  virtual page.

Below, you can see full *commands* file. This file was generating using additional program written in C++ (code available in git repository *generate\_commands.cpp*).

# Memory Management

| ./commands   |  |
|--------------|--|
| READ 0       |  |
| READ 16384   |  |
| READ 32768   |  |
| READ 49152   |  |
| READ 65536   |  |
| READ 81920   |  |
| READ 98304   |  |
| READ 114688  |  |
| READ 131072  |  |
| READ 147456  |  |
| READ 163840  |  |
| READ 180224  |  |
| READ 196608  |  |
| READ 212992  |  |
| READ 229376  |  |
| READ 245760  |  |
| READ 262144  |  |
| READ 278528  |  |
| READ 294912  |  |
| READ 311296  |  |
| READ 327680  |  |
| READ 344064  |  |
| READ 360448  |  |
| READ 376832  |  |
| READ 393216  |  |
| READ 409600  |  |
| READ 425984  |  |
| READ 442368  |  |
| READ 458752  |  |
| READ 475136  |  |
| READ 491520  |  |
| READ 507904  |  |
| READ 524288  |  |
| READ 540672  |  |
| READ 557056  |  |
| READ 573440  |  |
| READ 589824  |  |
| READ 606208  |  |
| READ 622592  |  |
| READ 638976  |  |
| READ 655360  |  |
| READ 671744  |  |
| READ 688128  |  |
| READ 704512  |  |
| READ 720896  |  |
| READ 737280  |  |
| READ 753664  |  |
| READ 770048  |  |
| READ 786432  |  |
| READ 802816  |  |
| READ 819200  |  |
| READ 835584  |  |
| READ 851968  |  |
| READ 868352  |  |
| READ 884736  |  |
| READ 901120  |  |
| READ 917504  |  |
| READ 933888  |  |
| READ 950272  |  |
| READ 966656  |  |
| READ 983040  |  |
| READ 999424  |  |
| READ 1015808 |  |
| READ 1032192 |  |

READ keyword is follow by a decimal value of an address to be read from virtual memory.

# Memory Management

## 3. Predicting page faults

Now, we will run the simulator and we will try to predict which READ operation will cause *page fault*. *Page fault* is a situation where virtual page is not mapped to any physical page and we attempt to read address from this virtual page. When it occurs proper physical page will be mapped to virtual page that informed about *page fault*.

Starting the simulator the following window appears:

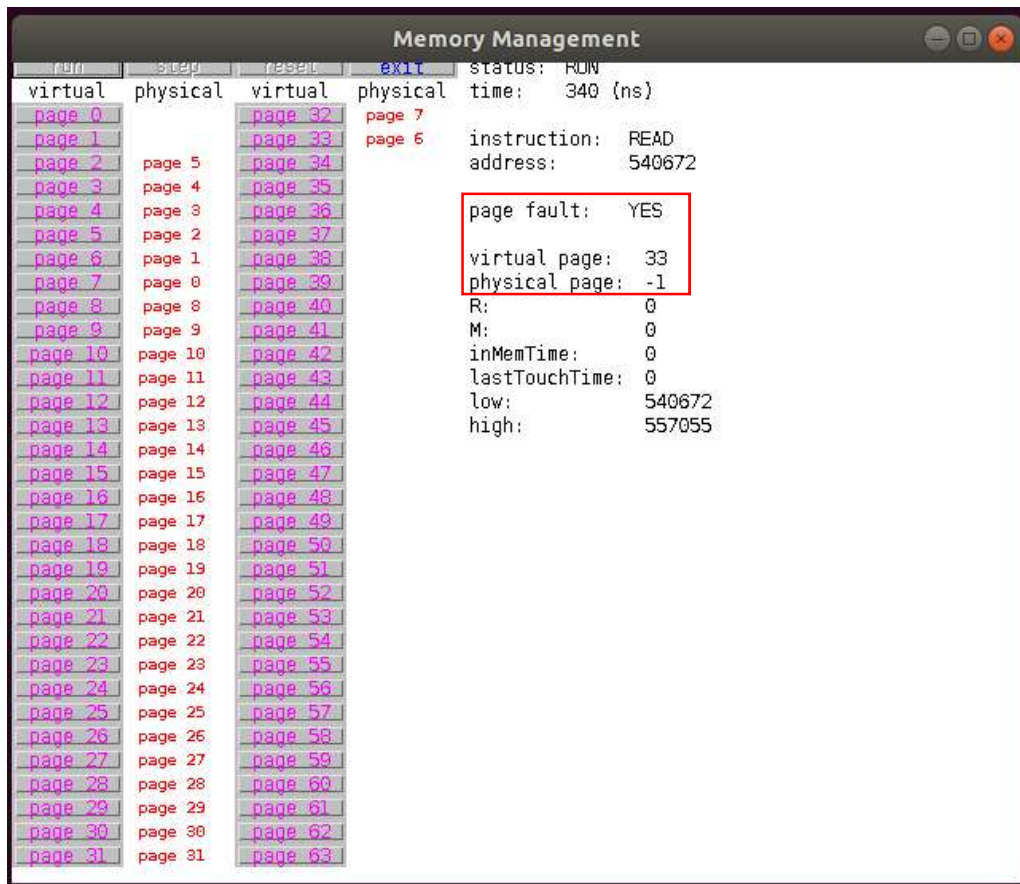

**Remark:** According to a *memory.conf* file mapping to first 8 virtual pages was performed. Others, visible in a simulator, mapping must have been performed by a simulator by default.

Looking at the simulator, to be specific how virtual memory is mapped to a physical one, we can see that every virtual page between 32-63 is not mapped to any physical page. Therefore, I am sure that reading addresses, within ranges of those virtual pages, will cause *page fault*. I will run a simulator and see an information appearing on the left panel to check if I am correct.

Below, you may observe screenshot of a window during running and see that page faults start exactly as predicted, meaning from reading address in virtual page #32 and follows to the end of simulation, meaning to the last reading address(from virtual page #63). This information is highlighted by a red rectangle applied on simulation window.

# Memory Management

Also, it can be noticed that my previous statement, about the fact that virtual pages which are not mapped to any physical page will cause page fault, is confirmed in this simulation because -1 assigned to a physical page indicates that virtual page is not assigned to any physical page.

Then *tracefile* file, which outputs information about if address was read correctly or caused page fault situation, can be looked at to indicate correctness of my predictions.

Table, containing output of a *tracefile* file, is present below.

# Memory Management

| ./tracefile |                             |
|-------------|-----------------------------|
| 0)          | READ 0 ... okay             |
| 1)          | READ 16384 ... okay         |
| 2)          | READ 32768 ... okay         |
| 3)          | READ 49152 ... okay         |
| 4)          | READ 65536 ... okay         |
| 5)          | READ 81920 ... okay         |
| 6)          | READ 98304 ... okay         |
| 7)          | READ 114688 ... okay        |
| 8)          | READ 131072 ... okay        |
| 9)          | READ 147456 ... okay        |
| 10)         | READ 163840 ... okay        |
| 11)         | READ 180224 ... okay        |
| 12)         | READ 196608 ... okay        |
| 13)         | READ 212992 ... okay        |
| 14)         | READ 229376 ... okay        |
| 15)         | READ 245760 ... okay        |
| 16)         | READ 262144 ... okay        |
| 17)         | READ 278528 ... okay        |
| 18)         | READ 294912 ... okay        |
| 19)         | READ 311296 ... okay        |
| 20)         | READ 327680 ... okay        |
| 21)         | READ 344064 ... okay        |
| 22)         | READ 360448 ... okay        |
| 23)         | READ 376832 ... okay        |
| 24)         | READ 393216 ... okay        |
| 25)         | READ 409600 ... okay        |
| 26)         | READ 425984 ... okay        |
| 27)         | READ 442368 ... okay        |
| 28)         | READ 458752 ... okay        |
| 29)         | READ 475136 ... okay        |
| 30)         | READ 491520 ... okay        |
| 31)         | READ 507904 ... okay        |
| 32)         | READ 524288 ... page fault  |
| 33)         | READ 540672 ... page fault  |
| 34)         | READ 557056 ... page fault  |
| 35)         | READ 573440 ... page fault  |
| 36)         | READ 589824 ... page fault  |
| 37)         | READ 606208 ... page fault  |
| 38)         | READ 622592 ... page fault  |
| 39)         | READ 638976 ... page fault  |
| 40)         | READ 655360 ... page fault  |
| 41)         | READ 671744 ... page fault  |
| 42)         | READ 688128 ... page fault  |
| 43)         | READ 704512 ... page fault  |
| 44)         | READ 720896 ... page fault  |
| 45)         | READ 737280 ... page fault  |
| 46)         | READ 753664 ... page fault  |
| 47)         | READ 770048 ... page fault  |
| 48)         | READ 786432 ... page fault  |
| 49)         | READ 802816 ... page fault  |
| 50)         | READ 819200 ... page fault  |
| 51)         | READ 835584 ... page fault  |
| 52)         | READ 851968 ... page fault  |
| 53)         | READ 868352 ... page fault  |
| 54)         | READ 884736 ... page fault  |
| 55)         | READ 901120 ... page fault  |
| 56)         | READ 917504 ... page fault  |
| 57)         | READ 933888 ... page fault  |
| 58)         | READ 950272 ... page fault  |
| 59)         | READ 966656 ... page fault  |
| 60)         | READ 983040 ... page fault  |
| 61)         | READ 999424 ... page fault  |
| 62)         | READ 1015808 ... page fault |
| 63)         | READ 1032192 ... page fault |

**Remark:** As predicted, reading first 32(0-31) virtual pages resulted in correct address reading and reading last 32(32-63) virtual pages resulted in page fault situation.

# Memory Management

## 4. Locating in the sources page replacement algorithm

Implementation of a page replacement algorithm can be found in `./task4/work/PageFault.java` file. To be more specific function in this class is called:

```
public static void replacePage(Vector mem, int virtPageNum, int replacePageNum, ControlPanel controlPanel)
```

From a documentation comment we can read that algorithm implemented is: FIFO(First-In First-Out).

**Algorithm Description:** The operating system maintains a list of all pages currently in memory, with the most recent arrival at the tail and the least recent arrival at the head. On a page fault, the page at the head is removed and the new page is added to the tail of the list.

Simulation confirms usage of this algorithm because when we will look at the step when page fault occurs. The first mapping that is removed was the first one that occurred. Below I present memory mapping after ending simulation.
